

IN THE CLAIMS

Please amend the claims as follows.

For the Examiner's convenience, a list of all claims is included below.

1. (Currently Amended) A method comprising:

 reading a time of exiting a reduced power consumption state ~~immediately prior to exiting~~
the reduced power consumption state in response to an interrupt, ~~wherein exiting is caused by~~
~~execution of an interrupt routine~~;

 storing the time of exiting of the reduced power consumption state in a register
~~immediately prior to exiting the reduced power consumption state~~;

 after the storing the time, allowing an interrupt routine associated with the interrupt to
execute;

 and

 calculating a reduced power consumption state duration based on the time of exiting the
reduced power consumption state stored in the register.
2. (Previously Presented) The method of claim 1 wherein the reduced power consumption
state is entirely responsive to the interrupt routine.
3. (Original) The method of claim 1 furthering comprising:

 reading a time of entering the reduced power consumption state;

 storing the time of entering the reduced power consumption state in a main memory; and

 calculating the reduced power consumption state duration utilizing the time of entering
and the time of exiting the reduced power consumption state.

4. (Canceled)

5. (Original) The method of claim 1 wherein the register is located in a processor.

6-47 (Canceled)

48. (Currently Amended) An apparatus comprising:

an operating system to read a time of entering a reduced power consumption state, and
to read a time of exiting the reduced power consumption state ~~immediately~~ prior to

exiting the reduced power consumption state, ~~wherein exiting is caused by execution of an
interrupt routine~~ in response to an interrupt; and

a main memory to store the time of entering, wherein the operating system is to allow an
interrupt routine associated with the interrupt to execute after the main memory stores the time of
entering.

49. (Previously Presented) The apparatus of claim 48 further comprising a chip to store the
time of exiting the reduced power consumption state in a register.

50. (Previously Presented) The apparatus of claim 48 further comprising a processor to store
the time of exiting the reduced power consumption state in a register.

51. (Previously Presented) The apparatus of claim 49 wherein the operating system further
operates to perform a cycle to the chip.

52. (Previously Presented) The apparatus of claim 48 wherein the operating system further operates to calculate a reduced power consumption state duration.

53. (Previously Presented) The apparatus of claim 48 wherein the reduced power consumption state is entirely responsive to the interrupt routine.

54. (Currently Amended) An apparatus comprising:

an operating system to request a chip to store a time of entering a reduced power consumption state and a time of exiting the reduced power consumption state ~~immediately~~ prior to ~~an interrupt routine causing an exit~~exiting the reduced power consumption state in response to an interrupt; and

the chip to store the time of entering and the time of exiting the reduced power consumption state in a register and to automatically calculate a reduced power consumption state duration, wherein the operating system is to allow the interrupt routine associated with the interrupt to execute after the chip stores the time of entering.

55. (Previously Presented) The apparatus of claim 54 wherein the reduced power consumption state is entirely responsive to the interrupt routine.

56. (Currently Amended) An apparatus comprising:

means for reading a time of exiting a reduced power consumption ~~immediately~~ prior to ~~an interrupt routine causing an exit~~exiting the reduced power consumption state in response to an interrupt;

means for storing the time of exiting the reduced power consumption state in a register;

means for allowing the interrupt routine associated with the interrupt to execute after the storing the time; and

means for calculating a reduced power consumption state duration.

57. (Previously Presented) The apparatus of claim 56 further comprising:

means for reading a time of entering the reduced power consumption state;

means for storing the time of entering the reduced power consumption state in a main memory; and

means for calculating the reduced power consumption state duration utilizing the time of entering and the time of exiting.

58. (Previously Presented) The apparatus of claim 56 wherein the reduced power consumption state is entirely responsive to the interrupt routine.

59. (Previously Presented) The apparatus of claim 56 wherein the register is located in a personal computer chipset.

60. (Previously Presented) The apparatus of claim 56 wherein the register is located in a processor.
